

Here is the summary of the raw data for the Doc Creator:

- * **Core Function:** Deep Research Agents are advanced AI systems designed to perform complex, long-running tasks involving extensive context gathering, analysis, and synthesis of information.
- * **Methodology & Architecture:** They operate by decomposing broad research questions into focused sub-tasks, employing iterative exploration, and often leveraging multi-step or hierarchical multi-agent system architectures.
- * **Capabilities & Impact:** These agents represent a paradigm shift, enabling AI to tackle open-ended problems and perform general-purpose task solving independently, moving beyond simple query responses.
- * **Industry Adoption:** Key players in the AI landscape, including Google (Gemini), OpenAI (ChatGPT), and frameworks like LangChain, are actively developing and integrating Deep Research Agent capabilities.
